

Guidelines lab book

Bachelor Biosciences

Version 2018-2019

Introduction

Keeping a laboratory notebook, or lab book, is part of doing scientific research. You will not only have to use a lab book during all lab courses, but also during research internships, when you start a PhD-project or work at a research & development department of a company. A lab book contains the base of your results and the reports you write. For that purpose, your lab book should be clear, legible and available for your supervisors in case your data is used in a scientific publication. The department of your internship is owner of your data and lab book.

This document states the guidelines to be followed when keeping a lab book, both before and during an experiment.

General guidelines

The purpose of a lab book is to provide all information needed for yourself *and* others to perform the experiment exactly like you originally did. The general guidelines result from this purpose.

1. The lab book is durable, you will have to use it during the entire study.
 - a. Use an A4 sized, ruled hard cover notebook. The first lab book will be handed out at the start of the first year; a new one can be bought at BeeVee (€ 2,-).
 - b. Write with a ballpoint pen (non-erasable).
 - c. Never use loose pieces of paper.
2. The lab book is legible, work neatly.
 - a. Do not work on scratch paper first, but write *everything* immediately, readable, in the lab book.
 - b. If scratch paper is really necessary, use the left pages of the lab book. On the right pages the information can be copied in a legible way.
 - c. Make corrections neatly.
 - d. In case of lack of space, refer to a correct clause by using an asterisk (*).
3. The lab book is well organised, others should also be able to find what they are looking for.
 - a. Use page numbers.
 - b. Make a table of contents on the first few pages. Name the experiments and courses in the first column and associated page numbers in the second column.
 - c. Start each new experiment on a new page, reserve enough space for each experiment.

Use of lab book before conducting an experiment

Administrative

1. Give date of conducting the experiment.
2. Give experiment title like in course manual.
3. Number experiments corresponding to those in the table of contents.

Research question and (if applicable) hypothesis

4. Describe the research to be conducted.
5. Be specific, e.g. add species to be studied or type of medium to be used.
6. Give, when applicable, a hypothesis.

Experimental protocol

7. Indicate relevant literature references, e.g. when a general protocol is used.
8. Give safety data of to be used chemicals.
9. Show required chemical calculations.
10. Give required dilution series.
11. Give, when necessary, a schematic overview of the experimental set-up.
12. Make a step-by-step overview of conduction of the experiment:
 - a. Describe every step into detail.
(Example of single step: add 100 µl NaOH 0,1 M to solution A)
 - b. List the steps.
 - c. Be concise.
 - d. Be thorough, making course manual unnecessary during the experiment.
 - e. In case an existing general protocol is used, do not copy by hand, but print and paste it in your lab book. Only referring to external sources is insufficient.
13. A detailed step-by-step overview makes copying lists of materials unnecessary.

Use of lab book during an experiment

Experimental protocol

1. List every deviation from the step-by-step overview; do not repeat the step-by-step overview.
2. Explain used codes on tubes/flasks/etc.
3. Give location of samples, e.g. used slot in gel, or used stove for incubation.

Observations and raw data

4. Show data with correct units.
5. Show, if applicable, drawing/picture/blotting paper/etc. Draw according to drawing rules for biological drawings (Skills Portal Biosciences: www.science.ru.nl/biologyskills).
6. Give filename and location of digital data, e.g. pictures.

7. Indicate what data is less reliable because of (possible) errors.
8. Save unusable data and keep it legible.

Analysed data

9. Analyse data, often by using calculations and software.
10. Depending on type of research and department, calculations in lab book are elaborate or brief. During lab courses, calculations are given in such a way that the teacher is able to judge their quality.
11. Show graphs/tables summarizing your results (like in results section of report).

Conclusion

12. Give concise conclusion based on your observations.
13. Link conclusion to research question and (if applicable) hypothesis.
14. Indicate if experiment needs to be replicated and give suggestions for further research.
